

## Quizzes for SQL for Data Analysis – Level 1

### Quiz #1 - Database Terminology

| #  | Question  | Answer  |
|----|---|---|
| 1  | A relational database is an organized collection of data like a logical container, and the data is stored as a collection of records. A record is like one line of text combined from multiple attributes related to some entity.             | Yes/No  |
| 2  | A database table looks like a two-dimensional array made up of rows and columns. Each row is related to a specific attribute and must have a pre-defined data type. Each column is a collection of attributes related to some logical entity. | Yes/No<br><br>Each column is related to a specific attribute and must have a pre-defined data type. Each row is a collection of attributes related to some logical entity.                    |
| 3  | A primary key is used to uniquely identify a single row in a table, and it must be based on a single column.  | Yes/No<br><br>It can be by using a single column or a group of columns that their combined values uniquely identify every row in a table.   |
| 4  | A foreign key is used to navigate from one table to another table. A foreign key is a column or group of columns in a table that references a primary key in another table in the database.   | Yes/No  |
| 5  | A relational model has the following building blocks:   | <ol style="list-style-type: none"><li>1. Entity, Attribute, Relationship</li><li>2. Entity, Columns, Rows</li><li>3. Schema, Attribute, Tables</li><li>4. Schema, Attribute, Entity</li></ol> |
| 6  | A database schema is a logical structure, constraints, and associations of a group of related tables inside a database. A schema is also a namespace of a collection of tables.   | Yes/No  |
| 7  | Metadata is data about the database structure. It is data about the database objects that will be used to store actual data.  | Yes/No  |
| 8  | An index is a special support table that keeps rows in a specific order. We will have a corresponding row in the index table for every row in the data table. The order of the rows in the index table will be based on the required index.   | Yes/No  |
| 9  | The role of indexes is to facilitate the retrieval of a subset of a table's rows and columns without the need to inspect every row in the table.  | Yes/No  |
| 10 | A major advantage to partitioning is that when we query data, the required data may be raised on a couple of partitions instead of scanning the entire table.   | Yes/No  |

## Quiz #2 - Creating Databases, Schemas and Tables

| # | Question   | Answer  |
|---|--|---|
| 1 | What is the proper flow to create a database instance with a schema and tables?  | <ol style="list-style-type: none"><li>1. Schemas, Database, Tables</li><li>2. Database, Tables, Schemas</li><li>3. Database, Schemas, Tables</li><li>4. Schemas, Tables, Database</li></ol>                                     |
| 2 | When creating a new database table, we must specify the list of attributes as columns and the data type of each attribute.   | Yes/No  |
| 3 | <p>The following SQL code will create a table called "netflix" and a schema called "titles". Inside the table, we will have an attribute called "title_type" as a varchar data type that can be a NULL value.</p> <pre>CREATE TABLE netflix.titles (   title_id varchar(10),   title_type varchar(5) NOT NULL );</pre>                                     | <p>Yes/No</p> <p>The following SQL code will create a table called titles and a schema called "netflix". Inside the table, we will have an attribute called title_type as a varchar data type that can not be a NULL value.</p> |
| 4 | <p>The following SQL code will create a table called "titles" that will accept rows only if the "release_year" column has a value greater or equal to 1999.</p> <pre>CREATE TABLE netflix.titles (   release_year integer CHECK (release_year &gt;= 1999) );</pre>   | Yes/No  |
| 5 | <p>The following SQL code will create a table called "credits" inside the "netflix" schema where the "title_id" is a foreign key to the "titles" table.</p> <pre>CREATE TABLE netflix.credits (   person_id integer,   title_id varchar(10) REFERENCES netflix.titles(title_id),   name varchar(300),   character varchar(300),   role varchar(10) )</pre> | Yes/No  |
| 6 | When using the INSERT INTO statement to insert new rows into a table, is it recommended to provide the values in   | Yes/No  |

|    |  |  |
|----|--|--|
|    | the correct order without mentioning the column's names.   | The recommended option is to explicitly list the columns before the values. In that case, we don't need to know the order of the columns in the table.   |
| 7  | The COPY command available in PostgreSQL can be used to insert a large amount of data from a CSV file. | Yes/No   |
| 8  | Using SQL, we can perform the following update and delete options:                                     | <ul style="list-style-type: none"> <li>• Update rows using the UPDATE statement</li> <li>• Rename columns or add new columns using the ALTER TABLE statement</li> <li>• Remove rows, columns, or tables using the DELETE statement</li> <li>• All answers are right</li> </ul> |
| 9  |  |  |
| 10 |  |  |

### Quiz #3 - Retrieving Data with Queries

| # | Question  | Answer  |
|---|---|---|
| 1 | The SELECT section as part of a query determines which columns to include in the query's result set.<br>The FROM section is used to identify the tables from which to retrieve data.  | Yes/No  |
| 2 | In the following query, the SELECT and FROM are keywords, and the list of columns and tables are called identifiers. Keywords and identifiers are case insensitive. On the other hand, a quoted identifier is case-sensitive.<br><br><code>SELECT title_id, title FROM netflix.titles;</code> | Yes/No  |
| 3 | Before applying a complex query, we can limit the number of records received from a query to a specific number by using the WHERE conditions.   | Yes/No<br><br><code>LIMIT</code> number of records  |
| 4 | Comments in SQL code are useful or the following main reasons:  | <ul style="list-style-type: none"><li>• Mentioning WHAT and WHY we were doing when creating a complex query</li><li>• Mute a specific line or a block of code for troubleshooting</li><li>• All answers are right</li></ul> |
| 5 | The following SQL code will filter all columns from all rows where the release year is between 1979 and 1989.<br><br><code>SELECT *<br/>from netflix.titles<br/>WHERE release_year BETWEEN<br/>1980 AND 1990</code>   | Yes/No<br><br>The upper and lower limits are inclusive.   |
| 6 | The following SQL code will filter rows where the "seasons" column has some value.<br><br><code>SELECT title, title_type, release_year,<br/>seasons<br/>FROM netflix.titles<br/>WHERE<br/>seasons IS NOT NULL</code>  | Yes/No  |
| 7 | The following SQL code will filter all rows with "SHOW" title type that their release_year is 2000 or all rows with "SHOW" title type that their runtime is more than 100mins.<br><br><code>SELECT title, title_type, runtime,<br/>release_year<br/>FROM netflix.titles<br/>WHERE</code>      | Yes/No<br><br>Missing parentheses. It should be: <code>title_type = 'SHOW' AND (runtime&gt;100 OR release_year = 2000)</code>   |

|    |   |   |
|----|---|---|
|    | <p>title_type = 'SHOW' AND<br/>release_year = 2000 OR runtime&gt;100</p>  |   |
| 8  | <p>The following SQL code will filter all rows where the "release_year" is not equal to specific years - 2000, 2004, 2010.</p> <pre>SELECT * FROM netflix.titles WHERE release_year NOT IN (2000, 2004, 2010)</pre>   | Yes/No  |
| 9  | <p>An alias is used to re-label a column name or table name or assign a label to those columns generated by expressions or built-in function calls.</p>   | Yes/No  |
| 10 | <p>A search pattern is useful for searching a portion of the information from a string-type column. When building a search pattern, we can combine text and wildcard characters. A wildcard is a special character used to match parts of a value. There are two wildcard characters: underscore and percent.</p> | Yes/No  |
| 11 | <p>The following SQL code will filter all rows with movies to TV shows with a title that starts with the word "Top".</p> <pre>SELECT title, title_type FROM netflix.titles WHERE title LIKE '%Top%'</pre>   | <p>Yes/No</p> <p>All movies or tv shows with a title that includes the "Top" word somewhere inside the title.</p> |
| 12 | <p>The following SQL code will the distinct list age_certification for movies or TV shows, excluding NULL values.</p> <pre>SELECT DISTINCT age_certification FROM netflix.titles WHERE age_certification IS NOT NULL</pre>  | Yes/No  |
| 13 | <p>The following SQL code will count the number of distinct age_certification rows.</p> <pre>SELECT DISTINCT COUNT(age_certification) AS unique_agecerti FROM netflix.titles; WHERE age_certification IS NOT NULL</pre>   | <p>Yes/No</p> <p>The distinct goes <u>inside</u> the aggregate function: COUNT(DISTINCT age_certification).</p>   |

|    |   |   |
|----|---|---|
| 14 | <p>The following SQL code will select all titles sorted by the "release_year" and the "runtime" column. This means that it will first order the rows by "release_year", but if some rows have the same "release_year", it will order them by "runtime".</p> <pre>SELECT title, release_year, runtime FROM netflix.titles ORDER BY release_year, runtime</pre> | Yes/No  |
| 15 | <p>In the following query, we are grouping the rows based on "title_type" that their "release_year" is more than 2000 and calculating the average "imdb_score" for each "title_type" group.</p> <pre>SELECT title_type, AVG(imdb_score) FROM netflix.titles WHERE release_year &gt;= 2000 GROUP BY title_type</pre>   | Yes/No  |
| 16 | <p>HAVING is working on individual rows from the source tables and WHERE is working on the group-level aggregated rows.</p>   | <p>Yes/No</p> <p>WHERE is working on individual rows from the source tables and HAVING is working on the group-level aggregated rows.</p> |
| 17 | <p>The order of query execution looks like the following pipeline. Each section receives the result of the previous section and produces an output that the next section takes as input.</p> <pre>FROM &gt;&gt; WHERE &gt;&gt; GROUP BY &gt;&gt; HAVING &gt;&gt; SELECT &gt;&gt; ORDER BY</pre>   | Yes/No  |
